

POWER SLIDE SYSTEM

When space limitations and costs preclude the use of a crane, the Power Slide System delivers a simple, safe, and efficient way to move heavy and oversized loads of 50 to more than 2,000 tons! With rugged construction built to withstand daily use and extreme loads, the Power Slide is fabricated in-house to provide a quick turnaround of customized solutions. Features including integrated lifting, side shifting and leveling pads can be tailored to the application needs.

Comprised of skid shoes powered by hydraulic push/pull cylinders over high-strength track sections that are able to span gaps, the system is ideal for moving large components such as turbines, generators, transformers, vessels, motors, and virtually any other heavy machinery or fabrication.
